# Job Application Clicker

**Our goal is to provide an entertaining user experience similar to other clicker games and entertain users.**

# User Profiles

**A. Students**

a. This game is perfect for students as it could work to reduce stress levels by poking fun at the current state of the job market. These users will want great quality of life features

b. This game has to be simple and loaded quickly since students don't have a lot of time in their day to get high scores. There should be an easy reward that they can achieve every time they log on.

**B. The unemployed**

a. This game is perfect for people who are unemployed as it will build confidence because they will see how easy it is to send applications to potential employers

b. It should be easy to click and track how many applications have been acquired maybe a large count

**C. Gamers**

a. This game is perfect for gamers as they will be able to shoot for high scores and improve their previous scores. Gamers are the types of user who will try to break the app or reach its upper limits so the app must be functional after so many clicks

b. Some sort of mega achievement that would be small enough to look possible but large enough that it would take weeks

# Must Have Features

**Clicker**: Button, when clicked increments counter. This value can be used to purchase upgrades.

**Upgrades**: When purchased, it increases the effectiveness of the clicker. Autoclickers, separate from the clicker object, automatically increases the value.

**Game State Preservation**: Let all game data persist between logins; score, upgrades, achievements etc.

**Progress Display**: Applications per click and applications per second.

**Reset Progress**: Players can reset their saved progress to start a new game. A confirmation message to prevent players from accidentally deleting their progress

# Environment

IntelliJ

Kotlin, plug-in (Kotlin Compose Multiplatform)

Compose Media Player

Json implementation(Storage)

Github (Job Clicker Repo)

# Challenges

**Alexander:**

Struggling to get used to the file system Learning how to work with the UI Had to hand off reset implementation

**Rodrigo:**

I struggled wrapping my head around the file structure at first, then I struggled to find the correct method for the audio player to work. struggled on a reset bug. Had to teach myself kotlin and loosely typed language
UI learned

**Daisy:**

Struggled with saving the game, and storing it (implementing JSON). Web browser and Desktop app storage is not connected, that would require a server, and player account.
